ONE-DAY APPLIED LEARNING PROGRAM

THE MODERN-DAY PROFESSIONAL

An institutional capability lab for employability, innovation confidence and industry readiness

02

PROGRAM

VALUE PROMISE: Graduate readiness • Applied problem-solving • Employer connection

AUDIENCE	DURATION	FORMAT	INVESTMENT
Students & early-career talent	1 day | 9:30-17:00	Interactive bootcamp	From INR 1,800

Why this matters now

FOR ACADEMIC LEADERS

Strengthen graduate employability and institutional industry relevance through applied problem-finding, storytelling and innovation.

WHY STUDENTS NEED IT

Students develop employer-valued problem-finding, storytelling, AI judgement and collaboration skills beyond grades and technical knowledge.

WHY ACADEMICIANS NEED IT

Academicians connect curriculum and mentoring to employability, interdisciplinary projects and stronger institutional engagement with industry.

What we will explore

- Build the capability portfolio of an adaptable, modern professional.
- Strengthen problem-finding, communication, digital fluency and ethical judgement.
- Translate academic work into language valued by employers and partners.

What participants gain

- **Find opportunity:** recognise novel problems with academic and industry relevance.
- **Show contribution:** frame work around outcomes rather than publication count alone.
- **Build an IP mindset:** recognise potentially novel, non-obvious solution elements.
- **Win collaboration:** communicate a credible value case to employers and funders.

INSTITUTIONAL RETURN

Stronger employability evidence, industry-ready student projects and more purposeful placement engagement.

THE MODERN-DAY PROFESSIONAL

Build capability beyond technical competence

A structured day for problem-finding, professional storytelling, AI judgement, inventive thinking and opportunity creation.

One-day learning journey

09:30-10:15	**The changing professional**	Explore AI, ambiguity and the new combination of human and digital strengths.
10:15-11:15	**Find problems worth solving**	Connect trends, stakeholder pain points and personal capability.
11:30-12:45	**Storytelling that travels**	Present evidence, contribution and impact for interviews and influence.
13:45-15:00	**Inventive problem-solving**	Use TRIZ patterns, contradictions and practical idea selection.
15:15-16:15	**Reverse brainstorming and IP awareness**	Uncover risks and identify defensible solution elements.
16:15-17:00	**Opportunity pitch**	Build relationship capital and a 60-day collaboration and growth sprint.

Who should attend

- Final-year undergraduate and postgraduate students
- Doctoral scholars, research associates and early-career faculty
- Placement and student-development cohorts

Methods & tools

- Opportunity and career mapping
- Storytelling with evidence of impact
- Collaboration, feedback and influence
- Responsible AI and digital judgement
- TRIZ, reverse brainstorming and IP
- Industry engagement and pitching

Takeaway toolkit

- A personal T-shaped capability and opportunity map
- An employer-ready professional story supported by evidence
- An inventive solution developed through TRIZ and reverse brainstorming
- A practical 60-day learning, networking and collaboration sprint

Investment & included value

Students: INR 1,800 **Faculty / professionals: INR 2,800**

Workbook, capability map, pitch template and participation certificate included.

Indicative fee; institutional cohort pricing is available. Taxes, travel and venue costs are additional where applicable.

BUILD GRADUATES WHO CAN RE-IMAGINE WHAT COMES NEXT

THE INNOVATION FRAMEWORK

Three pillars of innovation

An idea becomes strategically interesting when it is **unique**, **hard to do** and **value adding** at the same time. The programs build student capability across all three.

01 UNIQUENESS

Meaningfully different

Students learn to ask whether the problem, insight or solution is genuinely different from what already exists - not merely a new implementation of a familiar idea.

SKILLS BUILT

Problem discovery, reframing, prior-art awareness, assumption breaking, divergent thinking and TRIZ.

02 HARD TO DO

Technically defensible

Innovation needs technical or execution depth. Students learn to work with constraints, contradictions, evidence and experiments so the idea is more than a superficial concept.

SKILLS BUILT

Systems thinking, technical trade-offs, experimentation, prototyping, non-obviousness and execution discipline.

03 VALUE ADDING

Creates real value

A clever idea is not automatically valuable. Students learn to connect innovation to a real user, institution, industry or societal need and define the change it should create.

SKILLS BUILT

Stakeholder insight, outcome framing, evidence, adoption thinking, value articulation and storytelling.

Why all three have to come together

Unique + valuable, but easy to copy	Interesting, but difficult to defend or sustain.
Unique + hard, but low value	Technically impressive, but unlikely to matter outside the project.
Hard + valuable, but not unique	Useful engineering, but limited differentiation or innovation claim.
Unique + hard + value adding	**A stronger foundation for defensible innovation and meaningful impact.**

How I help students build the three muscles

DISCOVER
Find tensions, unmet needs and consequential problems.

CHALLENGE
Question assumptions and seek a genuinely different angle.

BUILD
Work through constraints, contradictions and technical depth.

VALIDATE
Test evidence, stakeholder value, utility and feasibility.

COMMUNICATE
Turn the work into a research, patent or industry story.

THE CORE HABIT

Do not ask only, “Can we build it?” Ask: “Is it different? Is it difficult enough to be defensible? Does it create enough value to matter?”

amarbanerjee23@gmail.com

FROM INNOVATION CAPABILITY TO OUTCOMES

What the three pillars are designed to enable

The objective is not idea generation for its own sake. Students learn to convert differentiated, substantive and useful ideas into stronger research, invention and industry-facing evidence.

Outcome 01 - Impactful research

UNIQUENESS
A consequential question, clearer research gap and a contribution that is meaningfully different.

HARD TO DO
Technical depth, rigorous methods, experiments, difficult trade-offs and credible evidence.

VALUE ADDING
A problem that matters to a field, stakeholder, industry, society or future system.

STUDENT-OWNED EVIDENCE
Problem landscape • novelty map • research question • experiment plan • contribution statement • publication pathway.

Outcome 02 - Patents and defensible IP

UNIQUENESS
Prior-art awareness and a clearly differentiated mechanism, method or system element.

HARD TO DO
Non-obvious technical substance, constraints and implementation depth that make the idea defensible.

VALUE ADDING
Utility, adoption potential and a reason the invention should exist beyond novelty alone.

STUDENT-OWNED EVIDENCE
Invention canvas • prior-art search terms • novelty hypothesis • non-obviousness rationale • prototype or evidence plan.

Outcome 03 - Industry-ready innovators

UNIQUENESS
Spot opportunities others miss and frame a differentiated response rather than repeating obvious solutions.

HARD TO DO
Move from idea to execution: handle constraints, collaborate, experiment, learn and improve.

VALUE ADDING
Connect technical work to business, user and societal outcomes and explain why it matters.

STUDENT-OWNED EVIDENCE
Problem brief • prototype or concept • decision rationale • outcome story • pitch • 30/60-day action plan.

WHAT ACADEMIC LEADERS CAN REVIEW AFTER A COHORT
Problem portfolio • research directions • possible IP candidates • experiment plans • industry-facing pitches • participant capability evidence • recommended next steps.

The program builds capability and stronger pathways. Publication, patent and hiring outcomes are not guaranteed and depend on the quality of subsequent work, evidence, review and execution.
